

Human-friendly. **Agent-native.**

A calmer way to work with PDFs.

Review, annotate, sign, redact, and rearrange
inside one focused desktop workspace.

The same workbench for people and agents.

One editor. One op engine.

MARKUP

Highlight, note, draw

SURGERY

Move, crop, extract

HANDOFF

CLI, JSON, MCP

Open a document. Make a mark. Keep the last mile human.

The editor keeps proposed changes visible as movable ghosts until Save.

The CLI and optional MCP server speak the same JSON operation contract.

Preview-style PDF review for Linux

Built for a quiet desktop workflow, with a clear review point before consequential edits.

Review notes, in context.

Small marks should stay attached to the page they explain.

REVIEW PRINCIPLE

A proposed edit is visible before it is written.

Keep this sentence visible while testing a highlight ghost.

The review window stays open while operations are proposed.

Notes can carry a short explanation without changing the page text.

A focused workspace makes the important line easy to find.

01	Read	Find the target in page context.
----	-------------	----------------------------------

02	Mark	Add a highlight, note, or shape.
----	-------------	----------------------------------

03	Save	Commit only after the review is clear.
----	-------------	--

From a careful review to a repeatable handoff.

The human sees the page. The agent gets a stable operation list.

```
omepreview apply document.pdf --ops edits.json -o out.pdf
```

Same engine. Same coordinates. A human confirmation point.

Consequential operations default to dry-run / propose so the final write stays deliberate.

That is the handoff: clear enough to automate, calm enough to review.
